DETAILED ACTION

Allowable Subject Matter

1. Claims 31-32 are allowed.

The following is an examiner's statement of reasons for allowance:

Claims 31 and 32 disclose a communication system and a method for communication messages comprising at least one portable and display unit onboard an aircraft that transmits and receives data communication, voice communication, and video communication; an aircraft communication and reporting system transceiver located on the aircraft to receive from and transmit to the at least one portable control and display unit (1) data communication, (2) voice communication, and (3) video communication; and at least one peripheral device located on the aircraft, wherein a user employs the at least one portable control and display unit to transmit messages to and receive messages from a remote operations center via the ACARS transceiver communicating through a VHF radio onboard the aircraft, the messages comprising the at least one of data communication, voice communication and video communication, wherein the at least one portable control and display unit is configured to transmit a vehicle position at a programmed interval which can only be turned off by encrypted command from a remote site.

Monroe discloses a system a system adapted for monitoring an aircraft while in route for collection and relay of situational awareness data relating to onboard conditions and, where desired, performance and structural data. The system also supplies the data to local and remote monitoring stations via both wired and wireless links. Also, while in route, roving personal, including personal on the transport, such as air marshal have access to this data using common

Art Unit: 2617

and inconspicuous devices, such as a laptop computer or PDA or equivalent device, equipped with a wireless data transceiver. The Air Marshal can have video, data and voice communications utilizing a standard wired or wireless earphone/microphone unit in connection with the laptop computer, PDA or equivalent. In addition, the transport vehicle includes a plurality of strategically placed cameras (paragraph 34-35, and 38).

Nelson and Heppe disclose a system wherein commercial aircraft operating in the VHF portion of the radio spectrum, uses a data protocol known as ACARS. The airborne equipment, ground station equipment and extended ground network cooperate to support end-to-end transmission and reception of digital information between an aeronautical mobile station and a ground-based end system (see Heppe paragraph 3, and Nelson paragraph 42).

Monroe in combination with Nelson or Heppe does not disclose that the at least one portable control and display unit, is configured to transmit a vehicle position at a programmed interval which can only be turned off by encrypted command from a remote site.

During a thorough search, closely related references were found.

Mendelson et al. (Mendelson), Pub. No. US 2003/0065428, discloses a system wherein information about the aircraft, including its active position and all the data will be transferred automatically to the ground without any option of interfering or disabling with the flow of information (paragraph 44).

However, there is no specific disclosure of the entity that is doing the transferring of that information can be turned off or disabled only by encrypted command from a remote site. In addition, Mendelson discloses that a transponder output signal is tracked, so that the position of the transponder can be constantly monitored. And, even if the transponder were to turn off, the

invention provides continuous transmission of an aircraft signal (paragraph 95). As such, Mendelson discloses that the transponder can be turned off, but not from the remote site.

Another reference, Pennarola, US publication No. 20060167598 (filing date: July 10, 2003) discloses a system that provides a function for handling emergencies. This considers both the possibility that the system may be disabled under the threat of arms and the need for the pilot to immediately intervene in the critical phases of a real emergency. To achieve the first objective the system always works automatically, and cannot be disabled by the pilot. In case of alarm the system sends messages, including disabling codes. The use of secure radio bands guarantees a secure connection with the ground control stations and makes it possible for the aircraft to send automatically, if the alarm event is triggered, standard messages that inform the competent authorities of the onboard situation and to receive any disabling signals from ground. For this reason it is possible to confirm the disabling of the entire system from a ground control station or from another aircraft after checking the received messages (example images). This covers the risk that the system may be shut down by accident, by "expert" telecommunications terrorists, or under threat of weapons (see paragraph 39).

Therefore, at the time of the invention, neither the combination of Monroe with Nelson or Heppe, nor any closely related prior arts disclose the above limitation. As such, claims 31-32 are found to be allowable over the prior arts.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue

Art Unit: 2617

fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
